Application: E40D/4R100 1989-UP
Subject: Center Support Gasket

To improve sealing between the center support and the center support hub, TransTec has developed a rubber coated metal gasket. This gasket was designed with the bonded material so that there is no chance of gasket blowout at the feed holes.

CAUTION: Mating surfaces of both the center support and center support hub must be smooth and flat to insure proper sealing. Wrong installation of gasket can block the forward clutch oil feed hole. Care must be taken when installing the gasket so that the forward clutch oil feed hole isn't blocked.

It is recommended that a thread locker compound be used on the mounting bolts and then progressively torque to 100-120 in.-lbs. in three steps.

All TransTec E40D/4R100 kits with a date code of D01 and later will have the new gasket under TransTec #10063.
