

Transtech **Bulletin**

Application: Toyota/Lexus

Subject: Converter Seal – Material Update

The material used for the converter seal for various Toyota/Lexus automatic transmissions/transaxles has been updated. The previous seal, TransTec #29910 (Toyota #90311-38029), was made of a blue silicone compound. There was concern in extreme heat conditions and in converter hub rough finish situations.

TransTec kits built after September, 2001 now contain an updated seal manufactured by NOK. It is made of Viton[®], and is black and brown in color. NOK manufactures this seal for current OEM and aftermarket production to the same specifications as the previous silicone part.

The new seal, TransTec #29172 (Toyota #90311-38077), is more durable and heat resistant than the previous seal.

Viton[®] is a registered trademark of Du Pont Dow Elastomers L.L.C.
