

Subaru 4 Speed 1999-up Phase 2 TransTec® Overhaul Kit Number 2398 Update

Subaru introduced a Phase 2 4EAT transmission for model year 1999 which included solenoids and a new external oil filter. The product development staff at Corteco researched this Phase 2 and found that additional components should be added to TransTec® overhaul kit number 2398 to cover the changes made by the manufacturer.

Additional components include new solenoid o-rings, a filter to case o-ring, an oil cooler tube washer and cooler line washers with a banjo fitting.

Another interesting note on the Phase 2 4EAT is that Subaru began to use the left and right axle seals for the 5EAT.

The required sealing components for the Phase 2 have been added to TransTec® overhaul kit **2398**.
